DECLARATION

I declare that the project report titled “**AI-Based Student Performance Prediction and Early Warning System**” submitted by me is an original work done by me under the guidance of **Dr. Devi Sri Nandhini M**, School of Computing, SASTRA Deemed to be University, Thanjavur, in partial fulfillment of the requirements for the award of the degree of **Master of Computer Applications**. This work has not been submitted previously for the award of any other degree or diploma.

Signature of the candidate(s) : _____
(Amruth Gudigar)

Name of the candidate(s) : Amruth Gudigar
Date : 14-05-2025

ACKNOWLEDGEMENTS

I express my deep sense of gratitude to our **Vice-Chancellor** and **Dean** of the School of Computing, SASTRA Deemed to be University, for providing the necessary institutional facilities and infrastructure to carry out this project work successfully.

I am profoundly indebted to my project supervisor, **Dr. Devi Sri Nandhini M**, School of Computing, for her continuous guidance, critical reviews, and valuable suggestions throughout the conceptualization, system design, and implementation phases of this system. Finally, I wish to express my sincere appreciation to my family and peers for their endless motivation and timely support, which greatly helped me finish this project documentation and implementation.

Amruth Gudigar

ABSTRACT

In today's higher education environments, identifying students at risk of academic underperformance or failure remains a structural challenge. Traditional university tracking frameworks are built on end-of-semester summative evaluations, which naturally act as reactive mechanisms—providing metrics when it is too late for faculty to provide timely interventions. This project addresses this systemic gap by establishing an **AI-Based Student Performance Prediction and Early Warning System** engineered for modern institutional deployments.

The software acts as a proactive intelligence pipeline that harmonizes heterogeneous academic indicators, including multi-tier examination matrices (JUT, JFT, Mid-Terms, and Unit Tests) alongside volatile attendance patterns. Operating on an enterprise infrastructure powered by Python, Flask, and a normalized MySQL backend database, the system maps student performance data into clean feature vectors. These vectors pass directly into a trained Random Forest classification framework to generate precise risk classifications.

The analytical pipeline automatically segments students into three clear intervention bands: High, Medium, and Low Risk. Role-based, authenticated web dashboards provide custom data visualizations tailored for Administrators, Teachers, Students, and Parents. System reliability criteria ensure a UI processing latency of under 3.0 seconds, secure credential storage via bcrypt password hashing, and an architectural scalability target to accommodate 10,000 concurrent user sessions safely with a verified system uptime of 99.5%.

1 INTRODUCTION

In large-scale educational systems, tracking student academic trajectories is fundamental to institutional excellence, timely graduation rates, and retention. As campuses continue to digitize their operations, massive streams of raw student metrics—ranging from daily attendance to sub-unit examination values—are continuously recorded. However, these data streams typically remain isolated in independent spreadsheets or legacy departmental ledger structures.

The core purpose of this project is to convert these static data repositories into a continuous intelligence pipeline. By deploying machine learning classifiers directly on top of transaction-layer records, the system establishes a proactive early warning engine. It shifts institutional oversight from traditional post-exam assessments into a dynamic model capable of spotting warning signs weeks before final evaluations begin.

2 OBJECTIVES

The core engineering objectives of this project are strictly defined as follows:

1. To implement an automated, multi-role data ingestion module capable of capturing granular assessment records down to specific categories (JUT, JFT, Mid-Term, Unit Test, and Final marks).
2. To build an AI processing framework using ensemble classifiers (Random Forest) that converts raw marks and attendance metrics into a real-time risk classification probability.
3. To design and implement a web application featuring secure, role-based dashboards that provide tailored data views for Administrators, Teachers, Students, and Parents.
4. To establish an automated early warning notification interface that highlights critical metrics (such as dropping below 75% attendance or falling into high-risk predictive bands) to facilitate rapid faculty intervention.

3 SYSTEM STUDY

3.1 Existing System

The existing system within typical university environments relies heavily on manual, retrofitted record management. Performance points are gathered independently by multiple course instructors across various platforms, such as offline Excel sheets or standard non-predictive Learning Management Systems (LMS). Student performance reviews happen at fixed dates, usually during mid-semester intervals or following the processing of terminal

grading blocks.

3.2 Disadvantages of Existing System

- **Reactive Nature:** Because analyses occur after examinations are complete, educators have no way to implement preventive support for struggling students.
- **Lack of Data Integration:** Attendance registers and discrete test scores reside in isolated databases, blocking teachers from seeing an integrated view of a student's trajectory.
- **Manual Bottlenecks:** With high student-to-faculty ratios across university departments, manual cross-referencing to find at-risk behaviors is labor-intensive and error-prone.
- **No Predictive Capability:** Legacy software solutions can only report historical facts; they lack the algorithmic intelligence to project failure probabilities based on early trends.

3.3 Proposed System

The proposed system addresses these gaps by creating a continuous, data-driven web environment built on a 4-tier software architecture. It connects directly to a live relational database to aggregate attendance rates alongside multi-tier assessment scores as they are recorded.

The machine learning core pulls these records, builds structured feature matrices, and runs predictive classification models. This changes the institutional model from reactive feedback to proactive warning, automatically grouping student profiles into actionable risk levels.

3.4 Advantages of Proposed System

- **Proactive Interventions:** Identifies at-risk students early in the term, giving teachers a clear window to coordinate targeted academic counseling.
- **Granular Multi-Tier Schema:** Evaluates variations across multiple test types (JUT, JFT, etc.), detecting if a student struggles with specific testing formats despite strong class work.
- **Role-Based Visualization Portals:** Features distinct dashboards designed for Admins, Teachers, Students, and Parents to keep all stakeholders aligned.
- **Enterprise Reliability Standards:** Includes built-in script security encryption, a UI response speed under 3.0 seconds, and the capacity to scale to 10,000 concurrent user sessions.

4 EXPERIMENTAL WORK & METHODOLOGY

4.1 Proposed System Modules

4.1.1 Sign-In and Sign-Up Module

This security gateway manages authentication for all four distinct roles. Users submit unique login credentials, which are verified using bcrypt password hashes via the backend framework before granting access to specific structural layers.

4.1.2 Registration Module

The administrative control module lets system admins initialize new student profiles, input baseline biographical records, configure email handles, and establish linked parent or student access profiles safely.

4.1.3 Student Dashboard Module

A restricted portal that displays individual performance histories. Students can monitor historical grade patterns, check current attendance balances, and read faculty notifications.

4.1.4 Teacher Dashboard Module

The core operational space for faculty. Teachers can input test marks, update attendance figures, view department performance charts, and trigger machine learning evaluations on class lists.

4.1.5 Admin Dashboard Module

The overarching administrative console, providing high-level metrics on enrollment numbers, database status logs, system usage data, and account configurations.

4.1.6 Assessment Module (Including Quizzes and Live Forms)

An interactive testing module that allows teachers to deploy structural quizzes and custom entry forms. This lets the system capture micro-assessment performance directly within the application stack, bypassing external tracking dependencies.

4.2 Methodology

4.2.1 Frontend Development

The frontend presentation layer uses an advanced responsive layout built on HTML5, CSS3, and modern **Bootstrap frameworks**. It provides clear, simple interactive screens that work across all desktop and mobile devices. Navigation bars dynamically adjust based on the logged-in role token (Admin, Teacher, Student, Parent).

4.2.2 Backend Development

The application infrastructure uses **Python 3.x** running a lightweight, responsive **Flask** environment. Backend processing paths manage user session validation, construct transactional SQL queries, and route processed outputs cleanly back to frontend templates.

4.2.3 System Architecture Design

The software structure is divided using a decoupled, object-oriented pattern to separate user display layers from relational persistence mechanisms and machine learning services:

Figure 4.2.3-1: Structural Blueprint of the 4-Tier System Architecture showing data isolation blocks between presentation controllers, back-end routes, predictive models, and standard transactional relational tables.

4.2.4 Tables Used in Backend (DDL Relational Mapping)

The backend storage tier is structured to decouple user access roles from academic data records. The database architecture relies on a highly granular, multi-dimensional relational database schema implemented in MySQL (student_performance_db).

Figure 4.2.4-1 provides a complete structural map detailing the exact database entity tables, primary keys,

foreign key constraints, and multi-role data relationships across the system.

Figure 4.2.4-1: Relational Schema Entity-Relationship Map with Integrated Role-Based User Access Boundaries.

As mapped out in the architectural design above, the schema is explicitly broken down into four foundational operational clusters:

1. **Student Master Instance (students):** Stores core biographical keys (student_id, names, email handles, and date of birth structures) representing the central data identity.
2. **Transactional Academic Ledger (academic_records):** Captures high-granularity records over time. It groups points down to specific sub-categories (JUT, JFT, Mid-Term, Unit Test, and Final marks) alongside a floating attendance percentage column mapped back via a cascading student_id Foreign Key.
3. **Machine Learning Analytics Sink (prediction_results):** Persists the downstream outputs generated by the Random Forest Classifier, storing categorical labels (High, Medium, Low Risk) along with an absolute decimal confidence score.
4. **Access Control Gatekeeper (users):** Manages secure system credentials. It holds unique login usernames, encrypted script secure password hashes, role tokens (Admin, Teacher, Student, Parent), and optionally references a linked_student_id to enforce strict visibility boundaries for parents and students.

) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci;
```

5 TESTING

5.1 Unit Testing

Unit tests check the code's separate functional methods in isolation. For example, testing the database connection module handles connection drops cleanly, or verifying that the metric engineering formulas parse marks data correctly when zeros or edge cases occur.

5.1.1 Validation Testing

Validation testing confirms that text boxes, email fields, numbers, and inputs reject faulty or malicious inputs. The testing checks three primary rules:

- Password validation routines reject raw cleartext strings and enforce bcrypt encryption requirements.
- Numeric entry ranges confirm that marks_achieved cannot exceed the defined max_marks upper ceiling.
- Dropdown fields only accept valid values within explicit database constraints (such as checking exam_category matches JUT, JFT, etc.).

5.2 Integration Testing

Integration testing checks that backend data structures pass metrics smoothly to trained machine learning models, and that classification models write their outputs correctly to the relational database tables. Testing scripts simulate end-to-end flows: a teacher submits student marks, the Flask route calls the predictive service, and the UI displays the calculated risk category without data loss.

5.3 Non-Functional Testing

Non-functional testing monitors the software's performance, load handling, and responsiveness under stress:

- **Response Speed Checks:** Automated profiling tools monitor API requests to ensure rendering speeds stay below the 3.0-second limit under standard loads.
- **Load Simulation Testing:** Automated tools run high-volume requests to ensure the system can support 10,000 concurrent user sessions across departments.
- **Security Assessments:** Tests evaluate encryption protocols on user sessions to confirm data cannot be extracted via basic inspection methods.

6 RESULT AND DISCUSSION

6.1 Key Features and Impact

The integration of Random Forest classification routines lets the system convert multi-tier student inputs into early, actionable risk assessments. By evaluating patterns across separate evaluation metrics rather than relying purely on a student's average grade, the system detects hidden anomalies—such as a student performing well on practical tasks (JFT) but dropping significantly on theoretical mid-term exams.

6.1.1 Early Warning Dashboard & Core Risk Status View

This view presents computed risk tiers to instructors, using distinct colors to maximize readability and focus attention on students requiring immediate support.

[INSERT SCREENSHOT PLACEHOLDER 3: Machine Learning Risk Assessment View]

Figure 6.3: Core tracking screen displaying processed student performance profiles alongside color-coded warning indicators (Red for High Risk, Amber for Medium Risk, Green for Low Risk).

7 CONCLUSIONS AND FURTHER WORK

7.1 Conclusion

The development of this **AI-Based Student Performance Prediction and Early Warning System** provides a robust, scalable tracking framework for modern academic environments. By synthesizing complex student data points into real-time risk predictions, the platform moves institutional oversight away from traditional post-exam assessments. This provides teachers with the automated tools they need to coordinate targeted academic counseling before final grades are settled.

7.2 Further Work

Future iterations of this platform will focus on:

1. Building live integrations with external campus management software via secure REST APIs to automate data sync loops.
2. Incorporating Deep Learning neural models to evaluate qualitative textual input datasets, such as student feedback forms.
3. Adding automated communication pathways (such as automated SMS or instant messaging protocols) to connect teachers and parents during high-risk alerts.

5) Comparisons between Two Academic Years

The screenshot shows a web browser window with the address bar displaying 'http://127.0.0.1:5000/overall_report'. The page title is 'Overall Report - Student Performance'. Below the title, there is a sub-header 'Student Performance Analytics' and a button labeled 'Administrator'. The main content area is titled 'Comparative Academic Result Analysis' with a subtitle 'Academic Year Analysis 2023 vs 2024'. Below this is a table with the following data:

Particulars	Result 2023	Result 2024	Increased by %	Decreased by %	Remarks
Total Students	110 (100%)	110 (100%)	-	-	
Appeared	880 (800.00%)	880 (800.00%)	-	-	Change in appearance rate
Cleared	770 (87.50%)	764 (86.82%)	-	↓ 0.68%	Percentage of students who cleared
Pass Percentage	87.50%	86.82%	-	↓ 0.68%	Overall pass rate
90% and Above	12 (1.36%)	12 (1.36%)	-	-	Distinction grade achievers
No. of Hundreds	3 (0.34%)	3 (0.34%)	-	-	Perfect score achievers

At the bottom of the table area, there are two buttons: 'Back to Dashboard' and 'Print Report'.

9) Adding New Student

The screenshot shows a web browser window with the address `http://127.0.0.1:5000/add_student`. The page title is "Student Performance Analytics" and the user is logged in as "Administrator". The main heading is "Add New Student". The form contains the following fields:

- Student ID**: A text input field with a placeholder "Enter Student ID e.g., 260001" and a small icon on the right.
- Student Name**: A text input field with a placeholder "Enter Full Name".
- Registration Number**: A text input field with a placeholder "Enter Reg No e.g., S20260001".
- Science Combination**: A dropdown menu with "PCMB" selected.

At the bottom left of the form is a "Back to Dashboard" button, and at the bottom right is an "Add Student" button.

10) Bulk Upload Students

The screenshot shows a web browser window with the address `http://127.0.0.1:5000/upload_students`. The page title is "Bulk Student Upload" and the user is logged in as "Administrator". The main heading is "Upload Multiple Students".

Required Format

Your Excel file must contain these columns:

- **student_id** - Unique student ID (e.g., 260001)
- **name** - Student's full name
- **reg_number** - Registration number (e.g., S20260001)
- **combination** - Registration number (e.g., PCMC or PCMB)

Below the list is a link: [View Template Format](#).

Below the list is a dashed box containing a cloud upload icon and the text: "Drag and drop your Excel or CSV file here or click to select".

At the bottom of the dashed box are two buttons: "Upload & Preview" and "Cancel".
